

IRIS - User Guide 2: Using Filters to Identify and Analyse Dwellings

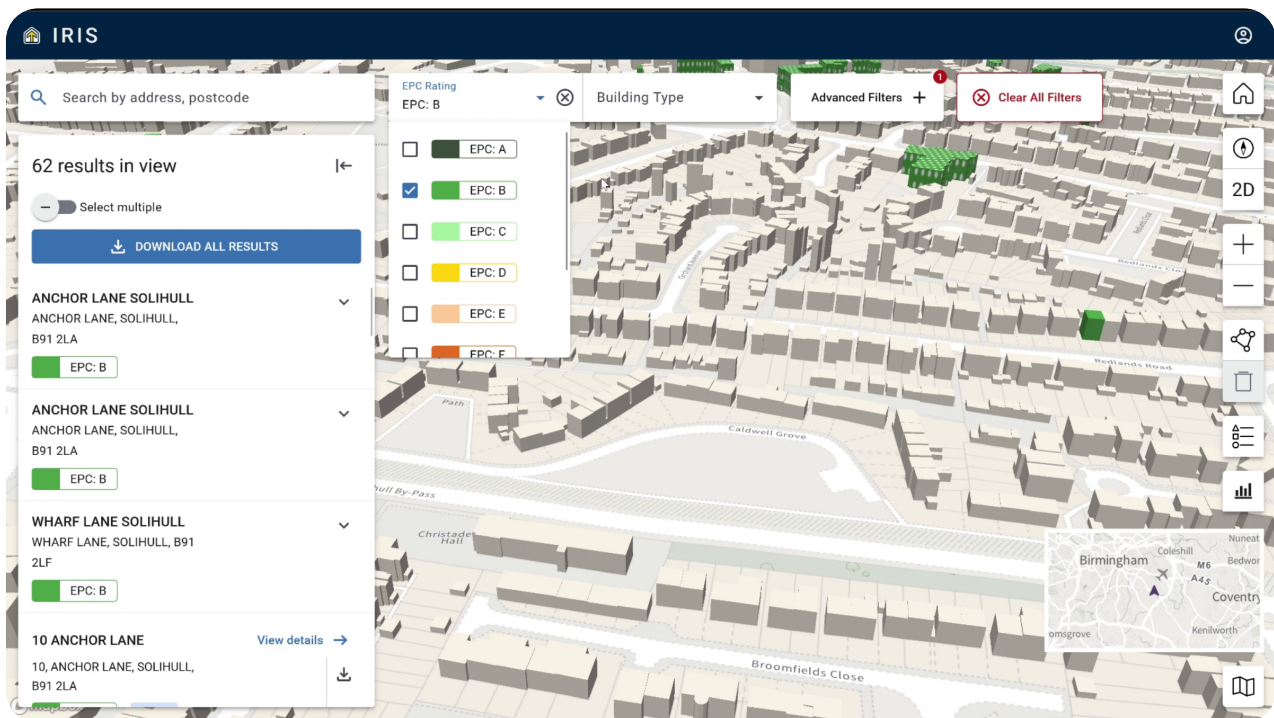

Powered by [guidde](#)

The objective of this guide is to use IRIS filtering options effectively and view their detailed building information.

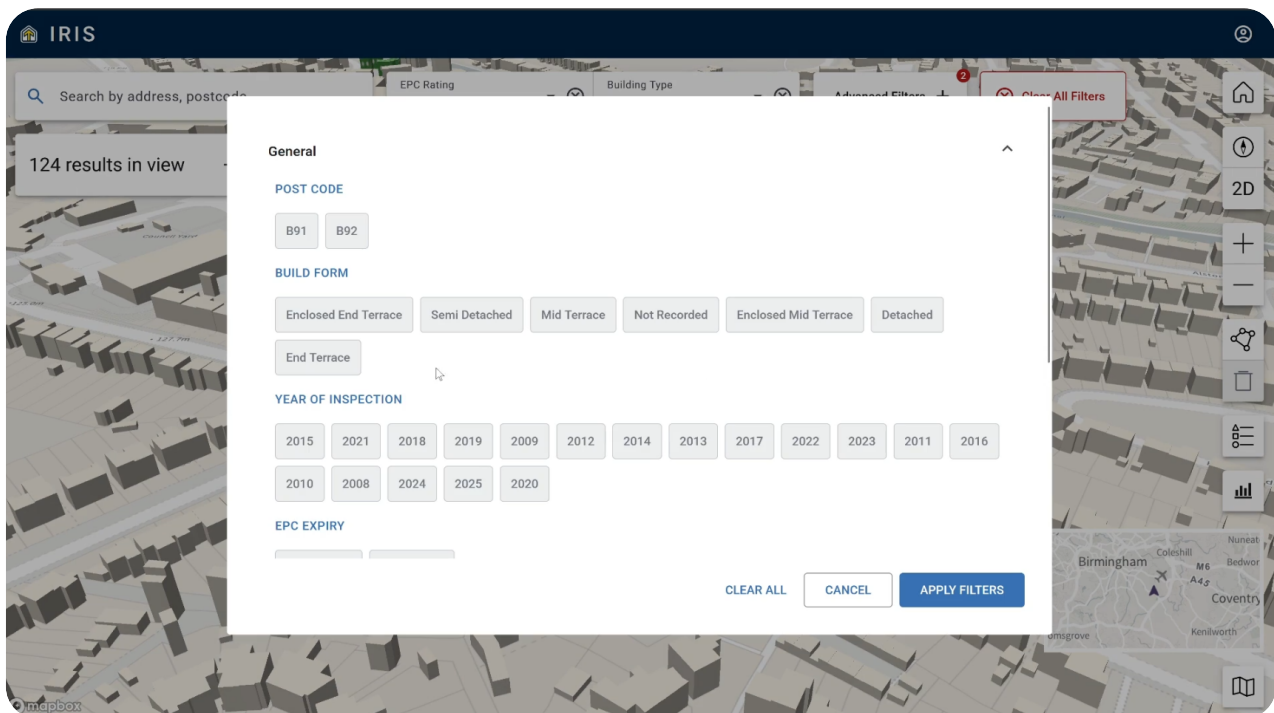

01 Using Filters

In order to identify dwellings of interest, you can make use of the various filtering options IRIS offers. For quick filtering on EPC rating and building type, use the filters to the right of the search bar.

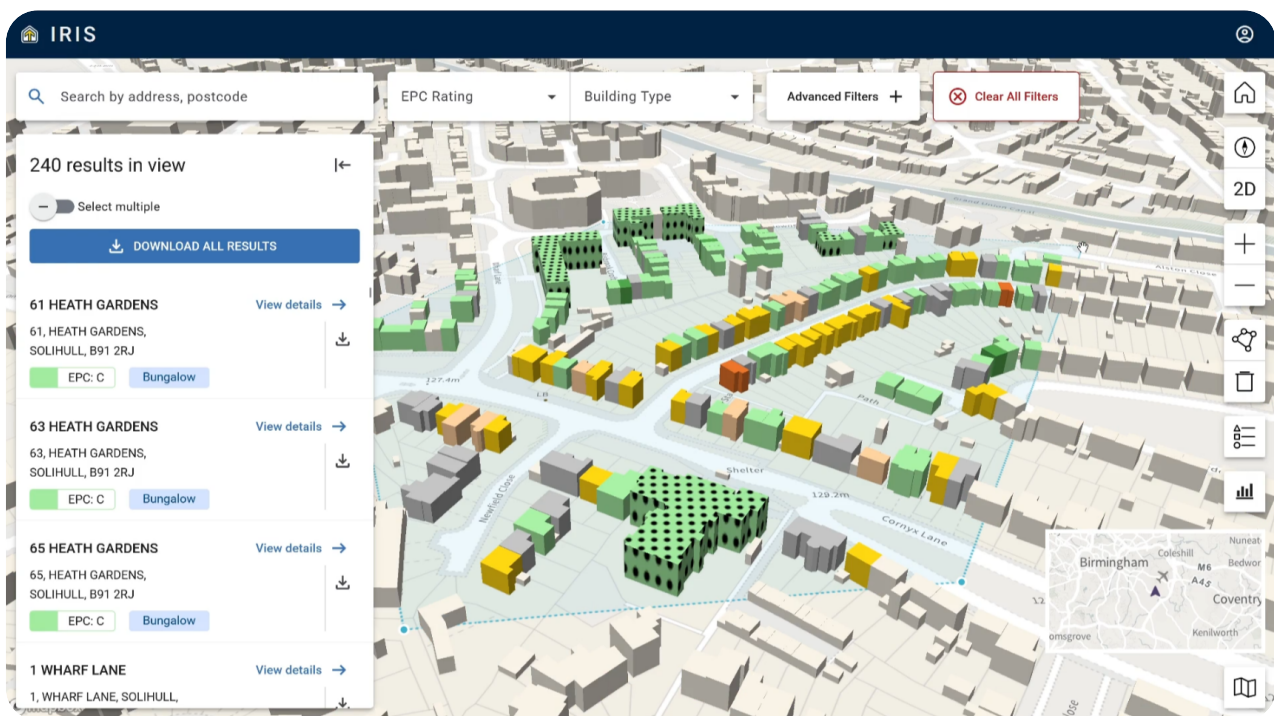

02 Advanced Filtering Options

Alternatively, click on the Advanced Filter pane for more precise filtering on the dwellings you are most interested in. Examples of the advanced filters include postcode, year of EPC inspection, floor construction, window glazing type and many more.

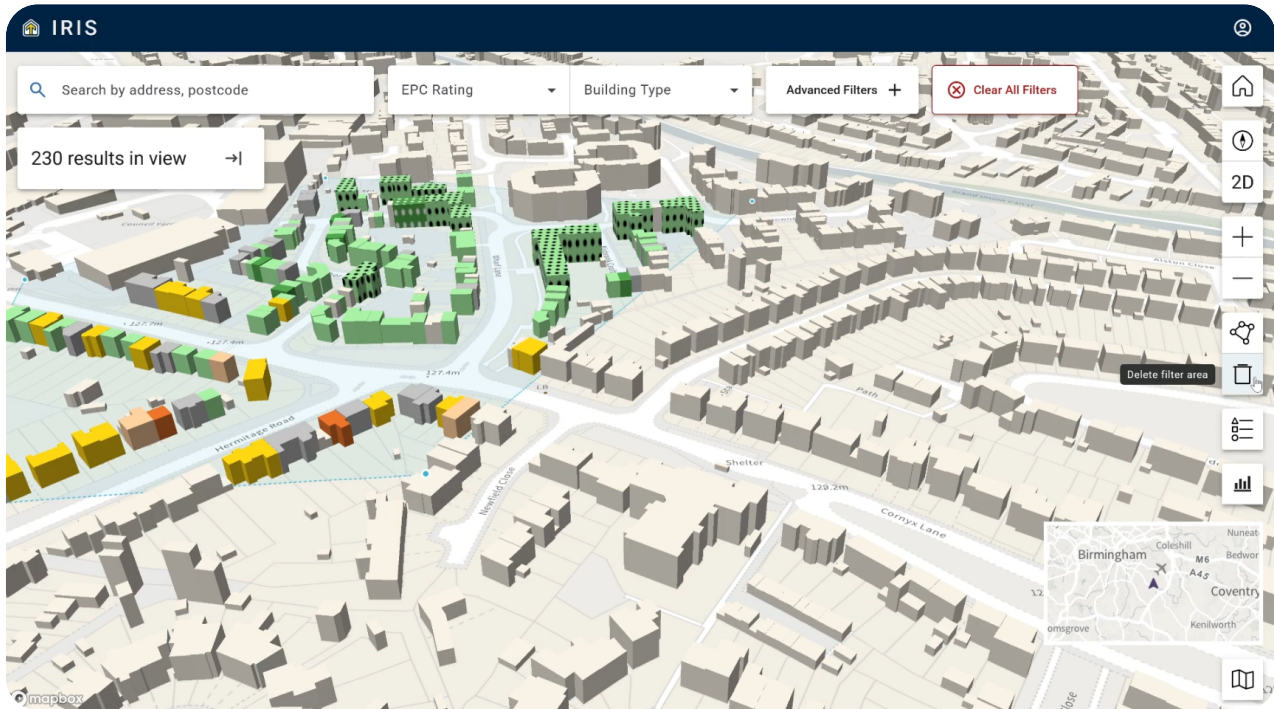

03 Filtering By User-Defined Area

IRIS also allows users to filter dwellings to those which sit within a user-defined area. To do this, click on the Draw Filter Area button on the right hand side. Draw a polygon by clicking where you would like the vertices to be. Finish drawing the polygon by double-clicking on the final vertices. IRIS will now only show dwellings within this filter area.

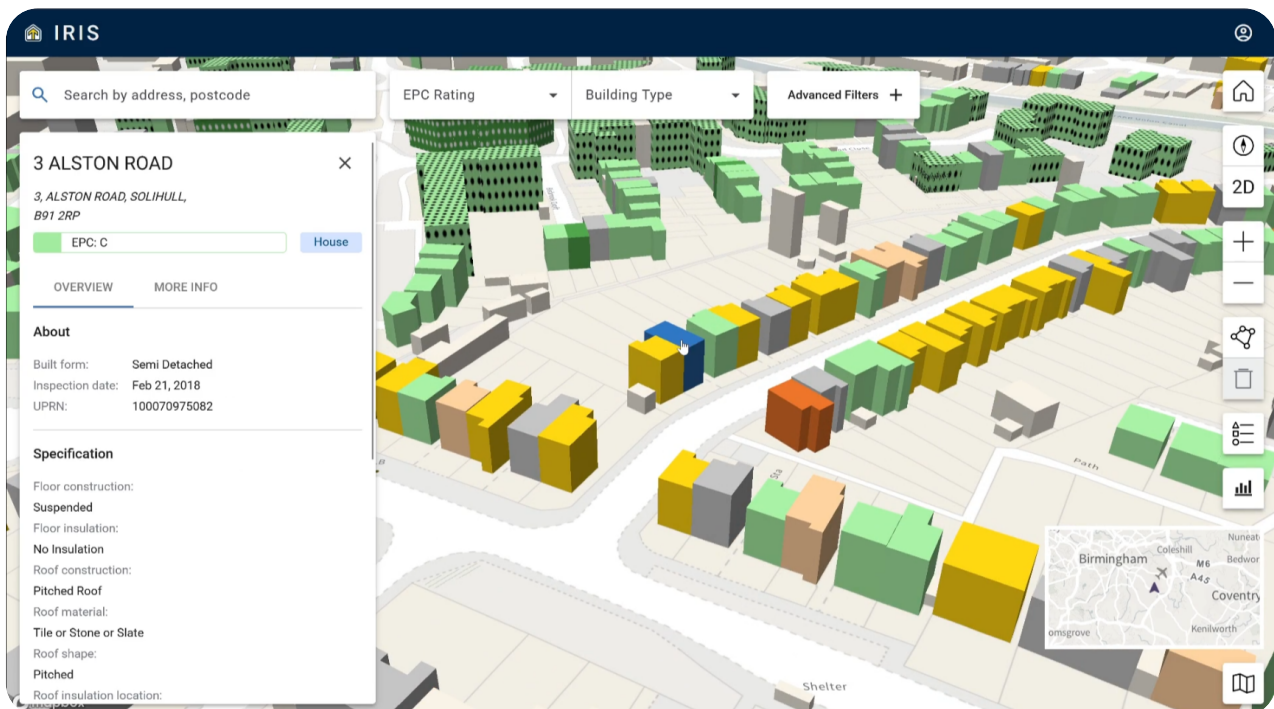

04 Moving And Deleting Filter Area

You can move the filter area by clicking and dragging it across the map. Delete this filter area using the bin icon on the right hand side.

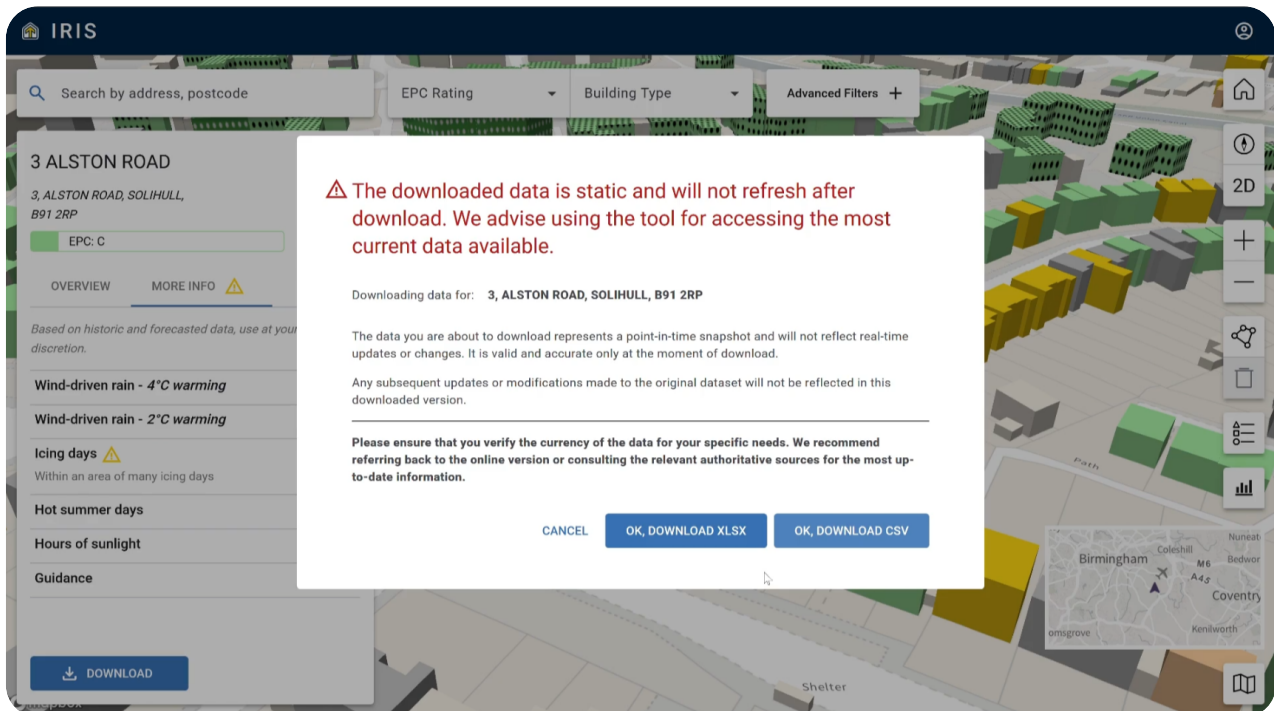

05 Viewing Detailed Dwelling Info

To view detailed information about each dwelling, you can click on any colored dwelling. This action opens a side panel displaying data specific to the dwelling such as EPC rating, inspection date, roof shape, floor insulation, and more.

06 More Info And Download

Within this side panel is an option to view more info on weather trends in the nearby area. To download data for a given dwelling, scroll to the bottom of the side panel and click the download button.
